## Description:

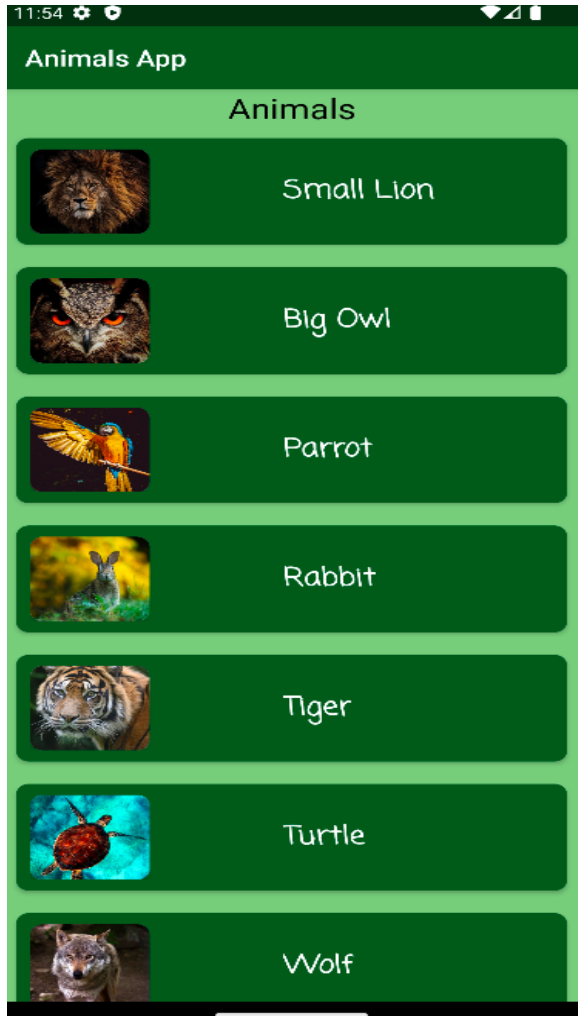

We created an animal app which can display different animals and the introduction to the animals. We used Android Studio as our IDE and applied our application into a Xiaomi cell phone.

We use firebase as our database. Users can add their animals and the introduction to the database.

We use GitHub as the log for our operations.

I chose this as my application because I a big fan for animals. But searching in search engine is so tedious and I have to spend more time collecting useful information. If we have this application, we can just look up information here.
